

Code Breaker - Are You Up

// Sparking Challenge Code Breaker

Tips

You can try comparing letters and strings using `<` or `>`, just like how you do it with numbers!

Example

Your code should have the following output:

```
isCapitalLetter("A")
> true
isCapitalLetter("b")
> false
```

Description

Over the next couple of stages, we'll be implementing little sections of the logic required to break the substitution ciphers.

In this first part, you are to:

- Write a function that checks whether a letter is uppercase and returns `true` if the letter is uppercase, and `false` otherwise.
